

exercice 39 =

1) Soit $A \in M_n(\mathbb{R})$ antisymétrique

On suppose par l'absurde que $A - I_n$ n'est pas inversible

$$\text{donc } \det(A - I_n) = 0$$

donc 1 est valeur propre de A associée au vecteur propre X non nul

$$AX = \lambda X$$

$$\begin{aligned} X^T A X &= X^T \lambda X \\ &= \lambda \|X\|^2 \end{aligned}$$

$$\begin{aligned} \text{or } X^T A X &= (A^T X)^T X \\ &= -X^T A X \quad \text{car } A^T = -A \end{aligned}$$

$$\text{donc } \lambda \|X\|^2 = 0$$

$$\text{donc } \lambda = 0$$

~~$\Rightarrow$~~ absurde
c'est

donc $A - I_n$ est inversible

2) on pose $M = (A - I_n)^{-1} (A + I_n)$

$$\begin{aligned} M^T &= (A + I_n)^T ((A - I_n)^T)^{-1} \\ &= (-A + I_n) (-A - I_n)^{-1} \\ &= (A - I_n) (A + I_n)^{-1} \end{aligned}$$

$$\cancel{M^{-1} = (A + I_n)^{-1} (A - I_n)}$$

$$\begin{aligned} \text{or } (A - I_n)(A + I_n) &= A^2 - I_n \\ &= (A + I_n)(A - I_n) \quad (*) \end{aligned}$$

$$\begin{aligned} M^T M &= (A - I_n) (A + I_n)^{-1} (A - I_n)^{-1} (A + I_n) \\ &= (A - I_n) [(A - I_n)(A + I_n)]^{-1} (A + I_n) \\ &= (A - I_n) [(A + I_n)(A - I_n)]^{-1} (A + I_n) \quad \text{d'après } (*) \\ &= I_n \end{aligned}$$

Donc

~~$\Rightarrow$~~ $M \in O_n(\mathbb{R})$

$$\begin{aligned}
3) \quad \det(M) &= \det(A + I_n) \det(A - I_n)^{-1} \\
&= \det(A + I_n)^T \det(A - I_n)^{-1} \\
&= \det(I_n - A) \det^{-1}(A - I_n) \\
&= (-1)^n \det(A - I_n) \det^{-1}(A - I_n) \\
&= (-1)^n
\end{aligned}$$

comme $M \in O_n(\mathbb{R})$,

$$M \in SO_n(\mathbb{R}) \Leftrightarrow \det M = 1$$

$$\Leftrightarrow n \text{ pair}$$
